

Configure Fire Station Settings

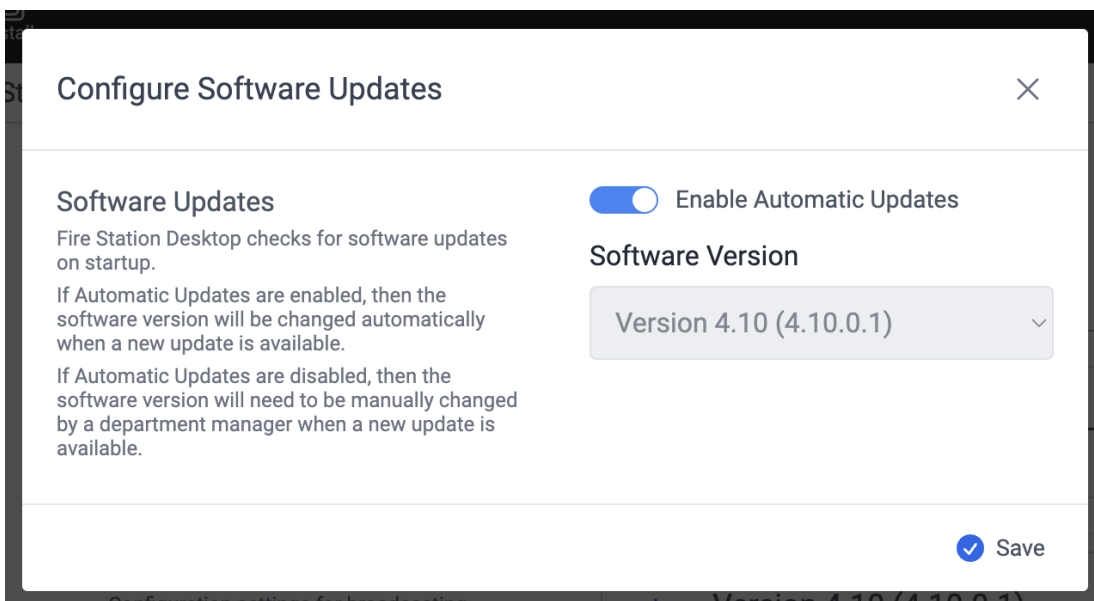

You need *Department Manager* permissions to make these changes

Configure Software Updates

You can choose the version of Fire Station Desktop that you want your department members to install, or you can choose to let them install the latest version as soon as it is available.

1. On a browser, go to <https://hub.firestationsoftware.com> and sign in.
2. In the left menu click *Settings* in the *Fire Station* section.
3. In the *Software Updates* section, click the "Configure" button on the right.
4. Choose one of the two options:
 - If you want your department members to install the latest updates as soon as they are available, then toggle "Enable Automatic Updates" on.
 - If you want to keep department members on a specific version, then toggle "Enable Automatic Updates" off, and select the version you want to install.
5. Click "Save".

Making changes to the settings will push a *configuration* update to all registered devices.

Configure Software Updates ✕

Software Updates

Fire Station Desktop checks for software updates on startup.

If Automatic Updates are enabled, then the software version will be changed automatically when a new update is available.

If Automatic Updates are disabled, then the software version will need to be manually changed by a department manager when a new update is available.

☒ **Enable Automatic Updates**

Software Version

Version 4.10 (4.10.0.1) ▾

☒ **Save**

Configure Policies

You can configure policies that control the settings for your department when they install or sign in to Fire Station Desktop.

Sign In Policy

- FSSID Sign In Optional - allow department members to sign in with their FSSIDs or using their database user. This option is not allowed if you use Cloud Data Hosting (CDH).
- Require FSSID Sign In - require department members to sign in with their FSSIDs only. If selected, this option cannot be undone. Members will have 30 days to create FSSIDs for sign in.

Offline Installation Policy

- Offline Installations Not Allowed - requires an internet connection to install Fire Station on a device.
- Offline Installations Allowed - allows department members to download installation files and transfer them to a device and install them without connecting to the internet. This option is only available to customers that have been grandfathered in to legacy systems.

To change policies:

1. On a browser, go to <https://hub.firestationsoftware.com> and sign in.
2. In the left menu click *Settings* in the *Fire Station* section.
3. In the *Policies* section, click one of the "Configure" buttons on the right.
4. Adjust the policies and click "Save".

Configure Sign In Policy

Require FSSID Sign In

FSSID sign in is encouraged for security purposes, but is disabled by default if your database is self-hosted.

If required, users will have 30 days to create an FSSID to sign in. Users will be prompted to create an FSSID the next time they sign in.

Require FSSID Sign In

WARNING: This action cannot be reversed

Allow Offline Installation

Allows devices to be registered via the department hub by a department manager. The installer and configuration bundle can then be download and transferred to the device and run without connecting to the internet.

This policy can only be changed by Fire Station Software support.

Allow Offline Installations
